

EnvisionWeb – the smart way to talk to your home from a webpage anytime, anywhere

We've introduced another way to have effortless and flexible fingertip control of all your home automation systems. Turn on one light or ten, it's now up to you.

Imagine being able to set the temperature, turn on the lights and close the blinds in your home before you leave the office – all from your laptop or your smartphone.

Now, EnvisionWeb, a sophisticated online interface that communicates with your Philips Dynalite control system, gives you the flexibility and freedom to monitor and manage your home systems via a user-friendly webpage wherever you are.

Once you're online, you can view the current status of lighting, HVAC and blinds settings in your home and adjust them as desired.

For example, you can 'log on' to your home to adjust lights individually or use lighting presets as well as setting your preferred temperature using a range of different settings such as 'performance', 'economy' or 'manual'.

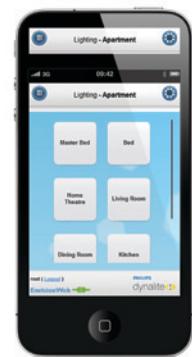

You can even integrate a number of home settings into preset sequences that can be run locally or remotely.

In other words, you can program 'a good morning' sequence that can help wake you up by switching on lighting, opening the blinds, turning on heating or cooling and even turning on the radio or TV.

Or you can log-on remotely and access your 'welcome home' sequence to light up your driveway, activate internal lights, turn on the music and set the temperature, all to your desired ambience.

It's easy to get started with the feature-rich and powerful EnvisionWeb. The innovative user-interface supports a wide range of web browsers and is simple to configure and customize so it works for you.

Total control of your smart home is now always at your fingertips with EnvisionWeb.
